

Projector

In a bid to empower the education sector, NEC India, an enterprise display solutions firm, launched its first 3D-enabled, DLP-based multifunction projector — NP216G — at a series of roadshows in Bangalore.

This portable, lightweight projector allows users to experience high-quality 3D visuals with the help of Brilliant Color technology. The average lamp life is extended up to 5000 hours with the use of its ECO Mode technology and power consumption lowered to 210W (0.7W in standby mode).

Power management allows the projector to turn off automatically when an incoming signal is not detected on any of the inputs, and its quick start (3-4 seconds) and shutdown technology allows immediate use and power-off functionality without the need for a cooling period.
